Resistant bacteria are a major threat to our health

All use of antibiotics leads to resistance. By using antibiotics only when really necessary, we can stem the trend towards resistance.

Bacteria in the urine of elderly people – why doesn’t everyone receive antibiotics?
Up to one-half of all elderly people have bacteria in their urine. In addition, there is a risk of losing bacteria that are protective for the urinary tract and in the intestines. Antibiotics also eliminate bacteria that have a protective effect, both in the urinary tract and in the intestines.

Antibiotics can cause side effects such as diarrhoea.

Antibiotics can cause side effects such as diarrhoea.

As a patient, it is important not to take antibiotics unnecessarily.

Urinesamples are taken in the case of clear suspicion of urinary infection.

In the case of urinary infection, the reason may be a urinary infection when urinating and frequent urges to urinate, as well as a burning sensation due to urinary infection.
